

ABOUT BILIARY ATRESIA

Approximately 1 in 10,000 children are born with Biliary Atresia each year.

It is a disease which destroys the bile ducts in the liver.

Despite decades of research, the cause remains unknown.

Without early surgical intervention, Biliary Atresia leads to liver failure and death.

Biliary Atresia is the leading cause of Liver Transplants in children.

Liver Kids Australia helps children with Biliary Atresia and their families.
